

Vibrato A1

Behind The world's first polymer saxophone...

To create more saxophonists in the world is our prime concern when making this saxophone. Our designer team needed to accomplish 3 objectives... Design a saxophone that everyone can afford, provide a standard fingering configuration and produce a solid saxophone sound. The solution: to replace brass with polymer. By doing so we not only change the material but also the process of saxophone manufacturing which has remained unchanged since 1843.

After 164 years the evolution has begun...
